

MICROPOLIS STREET LEVEL

Guide

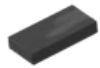

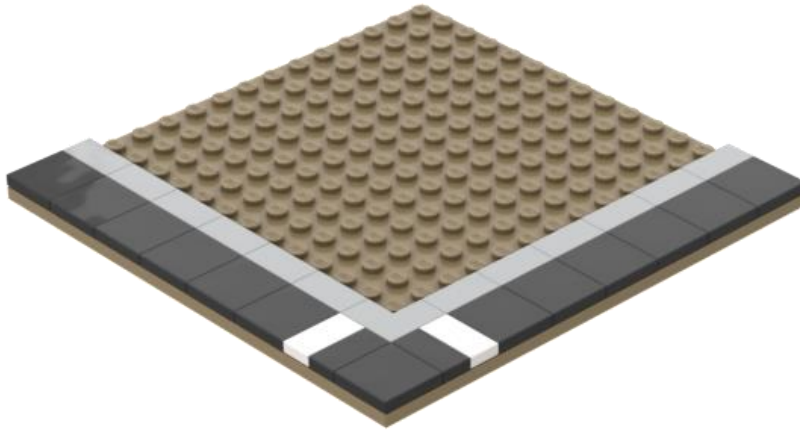

Guide by Magnus Karlsson.

Demarcation of Scope

This guide only covers the street level but not the base plate below.

Module A

Default version of Module A which is a corner module, developed by TwinLUG.

Roads

Two rows of Black Tiles.

Sidewalks

One row of Light Bluish Gray Tile.

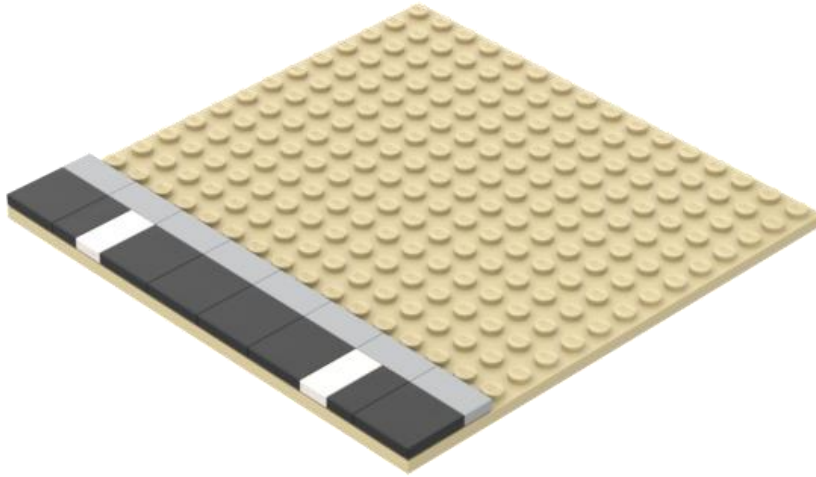

Crosswalks

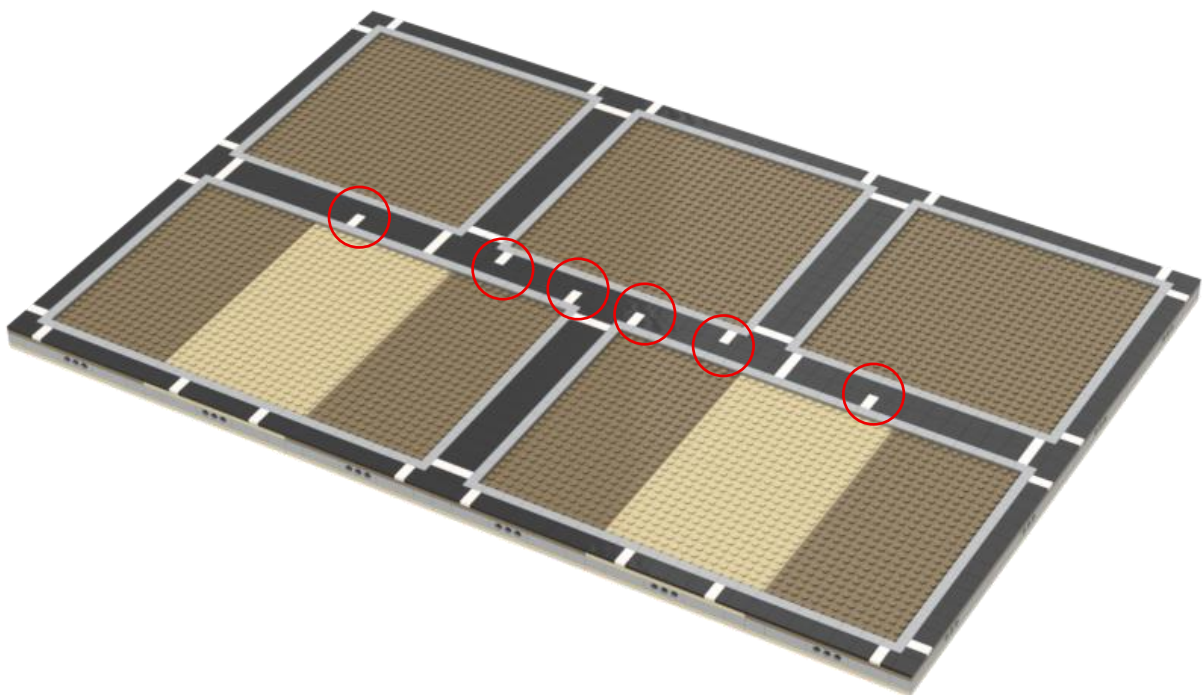

Two White 1x2 Tiles at the 4th stud position.

Module B

A straight street used to extend blocks or create T-intersections. When the B module is used, crosswalks need to be adjusted to fit with connecting modules.

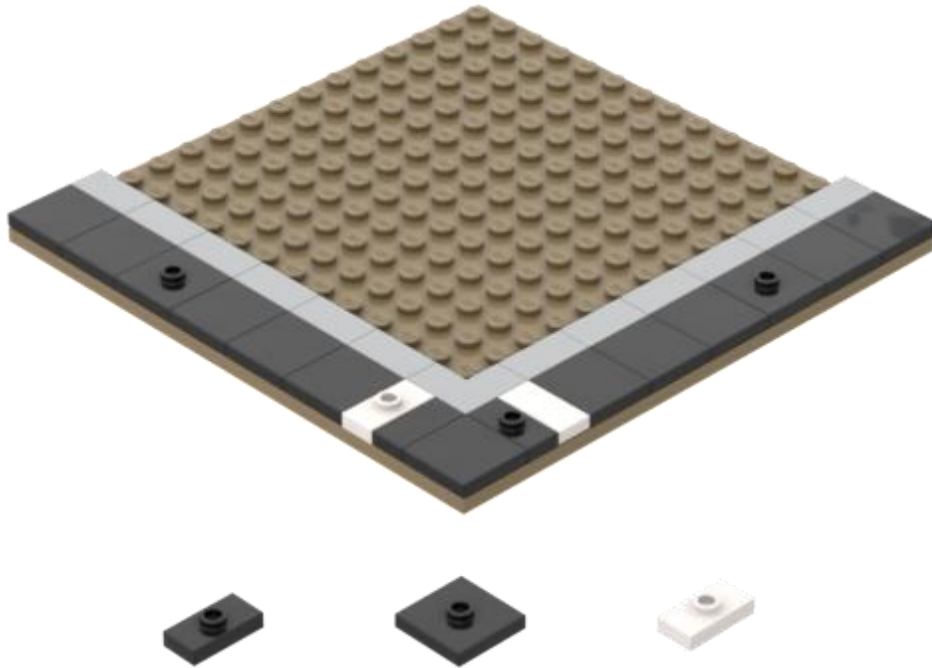

Below is an image to illustrate what can happen if crosswalks are not adjusted when Module A is combined with Module B.

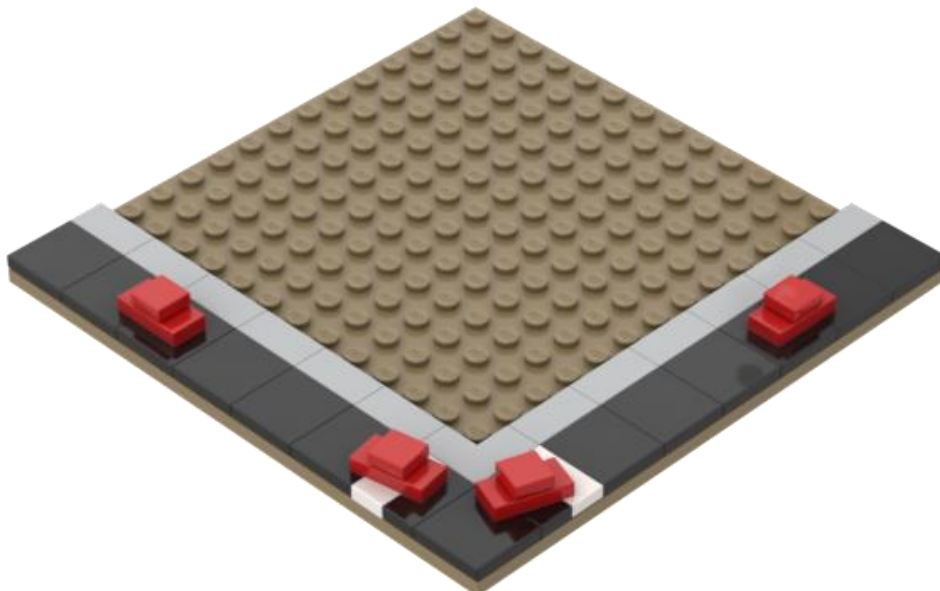

Circles mark where crosswalks are not aligned.

Adding Cars

Replace some tiles with jumper plates, or better yet, add them from the beginning. Add cars, buses and trucks.

Three types of jumper plates.

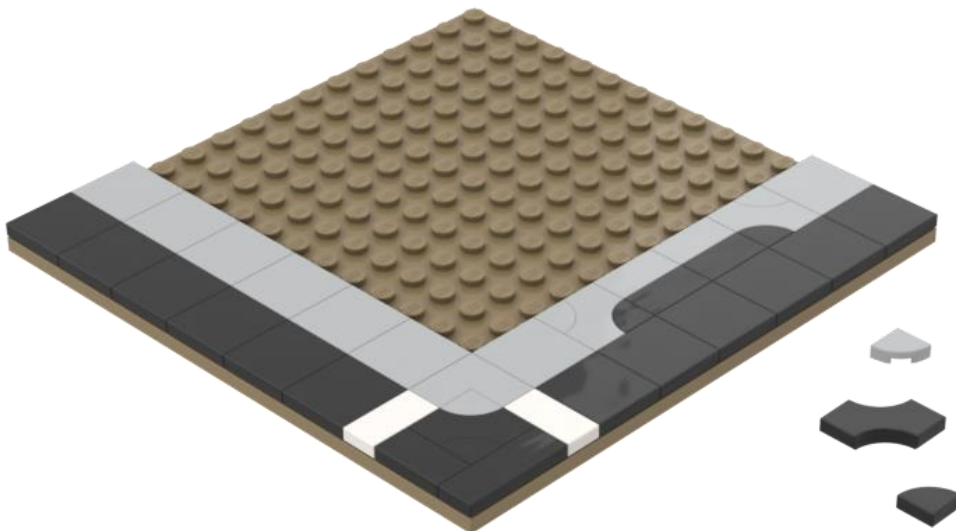

Big city traffic!

Further development

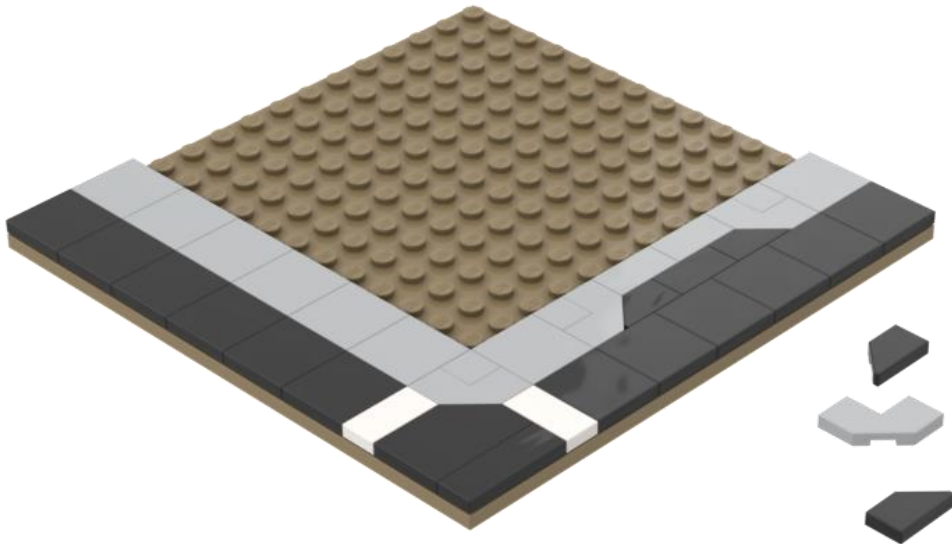

In recent years, we have received several pieces that can be used to create some variety and more exciting street designs, with fewer right angles.

- 3396, Tile, Modified 2x2 with 2 1x1 Curved Cutouts 2023
- 5091, Tile, Modified 1x2 Wedge Left 2024
- 5092, Tile, Modified 1x2 Wedge Right 2024
- 25269, Tile, Round 1x1 Quarter 2016
- 27263, Tile, Modified Facet 2x2 2017
- 35787, Tile, Modified 2x2 Triangular 2018

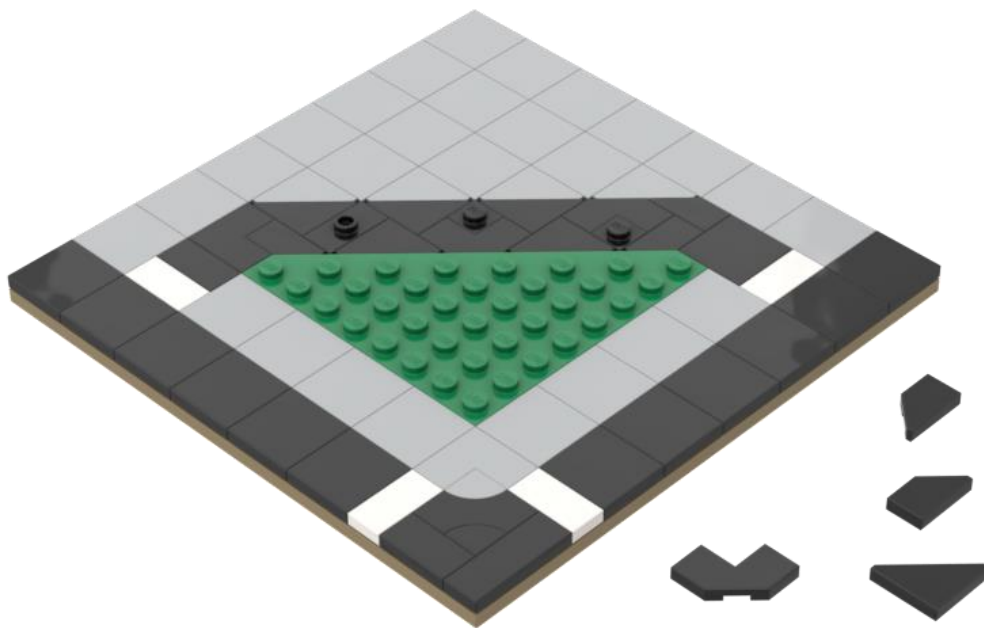

Let's look at some examples. For this, I am widening the sidewalk to two rows.

3396 and 25269 are used to replace a right-angled corner with a radius, as well as a parking space, bus stop or loading zone.

Here instead, 5091, 5092 and 27263 are used to create a chamfered corner, as well as the corresponding pocket.

In this example, 5091, 5092, 27263 and 35787 are used to create an angled entrance and exit for a gas station or hotel. A green wedge plate is used to close the gap that occurs at the street corner.
